I. Read the following passage and answer the questions that follow:

On August 6 1945 the first atomic bomb was dropped on Hiroshima in Japan. It produced an explosion equal to 20,000 tons of T.N.T (until then the most powerful explosion that the world had known). It killed about 200,000 people. If this bomb had not been used then, the world would not have realized to the full its destructive power. Since then, a hydrogen bomb has been perfected by certain world powers. It is believed that this terrible bomb, if it is exploded, will release energy equal to 100 megatons, that is to say one hundred million tons of T.N.T. The Hiroshima bomb killed 200,000 people. This is a terrible number of deaths; but if a single hydrogen bomb is used in warfare, it will kill about a thousand million people. If five such bombs are dropped in five inhabited continents, the entire population of the world, which is estimated at about three thousand million people, will be destroyed. This is why the great mass of the people in the world do not want another war. If there were another war and if hydrogen bombs were to be used in it, the whole world would be destroyed.
